

MIN SEOHYEON

TECHNICAL ARTIST | TOOLS, PIPELINES & REAL-TIME VISUALS

weare1842@gmail.com
github.com/Seohyeon-Min |
seohyeon-min.github.io/my_portfolio
linkedin.com/in/seohyeon-min

Technical artist who builds tools and content creation pipelines for artists - procedural destruction tools in Blender, artist-facing Unreal Engine editor tools, and real-time shaders in Unity and C++/OpenGL. Collaborates with artists and engineers, communicates problems and solutions clearly, and turns critique into the next iteration.

SKILLS

Tools & Pipelines	Blender Geometry Nodes, Python, Unreal Engine editor tooling, DataAsset workflows, C# editor tools and presets
3D / Game Engines	Blender (modeling, rigging), Unity URP, Unreal Engine (Cascade/Niagara VFX), custom C++/OpenGL engine
Real-Time Graphics	HLSL, ShaderLab, GLSL, OpenGL, UI shaders, framebuffer post-processing, procedural animation, RenderDoc
Programming	C++, C#, Python, C, JavaScript; object-oriented programming practices, debugging, performance profiling
Production / Tracking	Jira, Perforce, Git branching and merge review, GitHub Projects/Issues, Notion, CMake, Visual Studio

EXPERIENCE

RUIN FORGE ⚔

2026 - Present (In Progress)

Technical Artist - Procedural Tools (Personal) | Blender Geometry Nodes / Python

- Building a Blender Geometry Nodes tool that lets environment artists reposition one control object to regenerate a two-layer concrete break, exposed inner surface, and crack placement instead of hand-modeling each variation.

CARBOOM ⚔

2026 - Oct 2026

Gameplay Programmer / Technical Art - Tools | Unreal Engine / Python / C++ / Perforce / Jira

- Built an artist-facing Unreal Engine Python tool for the content creation pipeline that procedurally places space-background planets from artist-editable DataAsset parameters, so artists iterate on composition without code changes.
- Translated composition intent - apparent size, density, and clustering - into reusable placement controls, bridging environment-art direction and procedural content generation.
- Collaborated with the team's two artists, refining placement rules from in-editor critique; tracked work in Jira and Perforce.

POSEIDON SKATE ⚔

Sep 2026

Technical Art / Shader Development · Character Modeling & Rigging | Unity URP / HLSL / C# / Blender / Jira / Perforce

- Built ocean, wave, and tornado HLSL shaders (flow noise, domain warping, Voronoi caustics) as a rideable procedural water surface.
- Modeled and rigged a low-poly Poseidon character in Blender (25-bone skeleton) and integrated it into Unity via FBX.
- Authored a VFX splash-ring shader with randomized per-bump timing and Voronoi facet detailing for landing impacts.

STREET TYPER ⚔

Aug 2026

Technical Art / UI / Art | Unity URP / C# / ShaderLab / Notion

- Owned original 2D art, UI composition, particles, outlines, camera shake, hit VFX, and animated feedback for a shipped bilingual typing-combat game.
- Specified, evaluated, debugged, and integrated an AI-assisted reusable UI shader workflow for rounded forms, gradients, drop/inner shadows, blur, presets, and Inspector iteration.

TOO HOT! ⚔

Jul 2026

Technical Art / Visual Integration | Unity / ShaderLab / VFX / Notion

- Created and integrated the game's 2D shadow treatment, pattern-specific VFX, UI, animation, hit feedback, and visual hierarchy; tuned width and length controls for readable shadows across combat spaces.
- Specified GameManager and per-stage ScriptableObject data flow, save-range safeguards, chapter selection, and clean-state debug controls; reviewed teammate-authored gameplay implementations.
- Coordinated two programmers through a 130+ item P0-P3 backlog, communicating priorities and running code review, merges, and final visual integration.

NEW MANZO ⚔

Aug 2025 – Sep 2026

C# Programmer / Technical Art | Unity / C# / Notion

- Implemented procedural leg animation for a multi-legged boss using ground raycasts and step-arc motion.
- Built raycasting-based underwater visibility and post-processing for atmospheric rendering.

MANZO ⚔

Sep 2024 – Dec 2025

Graphics / Engine Programmer | C++ / OpenGL / GLSL / Notion

- Built a custom C++/OpenGL renderer with layer-sorted draw queues and a framebuffer-based post-processing pipeline for bloom, underwater distortion, god rays, ripples, and transitions.
- Implemented reusable particle motion types and integrated shader- and renderer-driven visual effects into gameplay scenes.
- Profiled severe frame drops, traced the issue to redundant per-frame collision checks, and removed the repeated work to stabilize performance. Largest repository contributor: 366 commits.

TEACHING ASSISTANT - GAME DEVELOPMENT PROJECT I

Spring 2025

- Supported ~30 DigiPen Korea students with C++ implementation and debugging, communicating problems and solutions through actionable technical feedback on team projects.

ADDITIONAL PROJECTS

ART FOUNDATION ⚔ - Dragon Head: modeled, sculpted, shaded, and rendered a stylized 3D asset from base mesh through final render.

UNREAL VFX ⚔ - Edge Drive: placed and adjusted existing VFX assets in Unreal Engine with basic Cascade and Niagara modifications.

OBJECT-ORIENTED ENGINE CODE ⚔ - Double Hit: C++ texture/sprite management, collision, and GameObject/GameComponent architecture.

EDUCATION

B.S. Computer Science in Real-Time Interactive Simulation | Expected Graduation: May 2028

Keimyung University / DigiPen Institute of Technology | GPA 3.958/4.0
