DV Trading Hiring Team
Software Engineer Intern - Summer 2027 (DV Commodities)

I enjoy object-oriented programming, particularly designing and structuring systems with maintainability and reusability in mind. When I write code, I enjoy thinking beyond simply implementing the feature I need at the moment and considering how the code I have already written can be reused. For Manzo, I built the game's renderer - a layer-based draw queue and a ping-pong framebuffer pipeline for post-processing - and later, when boss fights started dropping frames badly, traced the cause to redundant collision checks running every frame and rewrote the logic to remove them. I enjoy that kind of work: not just making something run, but figuring out why it doesn't and fixing it properly.

I also work well as part of a team with people in different roles. While developing Too Hot, I reviewed every teammate's code and gave feedback, and just as often took feedback on my own work in return - I care as much about how a team gets to a working build together as I do about my individual contribution.

I am applying for the Software Engineer Intern position at DV Trading because I want to apply my C++ systems-building and performance-debugging experience to low-latency software. My experience building a custom engine, tracing frame drops to redundant collision checks, and fixing memory ownership issues has taught me to think carefully about performance and correctness. I am excited by the opportunity to work in an established codebase, contribute to a focused project, and learn how reliable systems support real-time financial markets.

Thank you for considering my application.

Sincerely,
Seohyeon Min
