Epic Games Hiring Team
Gameplay Programmer Intern — Fortnite

I enjoy object-oriented programming, particularly designing and structuring systems with maintainability and reusability in mind. When I write code, I enjoy thinking beyond simply implementing the feature I need at the moment and considering how the code I have already written can be reused. While implementing boss patterns in Unity, I spent considerable time thinking about how to structure them so that I would not have to write everything from scratch whenever I added a new pattern.

I bring the same thinking to C++. For Manzo, I built the game's renderer — a layer-based draw queue and a ping-pong framebuffer pipeline for post-processing effects like bloom and underwater distortion — and later, when boss fights started dropping frames badly, traced the cause to redundant collision checks running every frame and rewrote the logic to remove them. I enjoy that kind of work: not just making something run, but figuring out why it doesn't and fixing it properly.

I also enjoy the process of making games as a team. Working alongside teammates with different responsibilities toward a shared goal, and eventually seeing everyone's work come together into a finished game, is one of the most rewarding parts of game development for me. While developing Too Hot, I reviewed every teammate's code and gave feedback, and just as often took feedback on my own work in return — I care as much about how a team gets to a working build together as I do about my individual contribution.

Since deciding in high school that I wanted to work in the game industry, I have pursued that goal by studying computer science and game development at DigiPen. I am applying for the Gameplay Programmer Intern position at Epic Games because I would like to bring together the two things I have enjoyed throughout that path: programming and building games as part of a team.

Thank you for considering my application.

Sincerely,
Seohyeon Min
