Roblox Hiring Team
Software Engineer Intern — San Mateo, CA

I enjoy object-oriented programming, particularly designing and structuring systems with maintainability and reusability in mind. When I write code, I enjoy thinking beyond simply implementing the feature I need at the moment and considering how the code I have already written can be reused. For Manzo, I built the game's renderer — a layer-based draw queue and a ping-pong framebuffer pipeline for post-processing — and later, when boss fights started dropping frames badly, traced the cause to redundant collision checks running every frame and rewrote the logic to remove them. I enjoy that kind of work: not just making something run, but figuring out why it doesn't and fixing it properly.

I also work well as part of a team with people in different roles. While developing Too Hot, I reviewed every teammate's code and gave feedback, and just as often took feedback on my own work in return — I care as much about how a team gets to a working build together as I do about my individual contribution.

I am applying for the Software Engineer Intern position at Roblox because it sits at the intersection of the two things I care about most: engine-level systems programming and building tools that let a huge number of other creators make things. I've spent the last two years building a custom C++ engine from the ground up — layer-based rendering, framebuffer post-processing, collision, and performance debugging — and I want to bring that engine-building instinct to a platform whose entire product is a creation engine used by millions of people.

Thank you for considering my application.

Sincerely,
Seohyeon Min
