AnaVation Hiring Team
Computer Science Intern — Huntsville, AL

I enjoy object-oriented programming, particularly designing and structuring systems with maintainability and reusability in mind. When I write code, I enjoy thinking beyond simply implementing the feature I need at the moment and considering how the code I have already written can be reused. For Manzo, I built the game's renderer — a layer-based draw queue and a ping-pong framebuffer pipeline for post-processing — and later, when boss fights started dropping frames badly, traced the cause to redundant collision checks running every frame and rewrote the logic to remove them. I enjoy that kind of work: not just making something run, but figuring out why it doesn't and fixing it properly.

I also work well as part of a team with people in different roles. While developing Too Hot, I reviewed every teammate's code and gave feedback, and just as often took feedback on my own work in return — I care as much about how a team gets to a working build together as I do about my individual contribution.

I am applying for the Computer Science Intern position because I want to apply the same systems-building and debugging discipline I've developed in game engines (Manzo, a custom C++ engine with 366 commits) to mission-focused software, in a setting where correctness under real constraints matters as directly as it does in a real-time engine.

Thank you for considering my application.

Sincerely,
Seohyeon Min
