Northwood Space Hiring Team

Software Engineer Intern, Multiple Teams — Los Angeles / Torrance, CA

I enjoy object-oriented programming, particularly designing and structuring systems with maintainability and reusability in mind. When I write code, I enjoy thinking beyond simply implementing the feature I need at the moment and considering how the code I have already written can be reused. For Manzo, I built the game's renderer — a layer-based draw queue and a ping-pong framebuffer pipeline for post-processing — and later, when boss fights started dropping frames badly, traced the cause to redundant collision checks running every frame and rewrote the logic to remove them. I enjoy that kind of work: not just making something run, but figuring out why it doesn't and fixing it properly.

I also work well as part of a team with people in different roles. While developing Too Hot, I reviewed every teammate's code and gave feedback, and just as often took feedback on my own work in return — I care as much about how a team gets to a working build together as I do about my individual contribution.

I am applying for the Software Engineer Intern role because I want to take the systems-building and debugging habits I've developed in C++ game engines and apply them to Northwood Space's work on space communications infrastructure — software where reliability isn't optional.

Thank you for considering my application.

Sincerely,
Seohyeon Min
